Deployment Testing SOP

- It is an ACSAP requirement that units obtain an Installation Deployment Testing SOP that has been reviewed and approved by the installation ADCO.
- The Deployment Testing SOP is really an extension of an installation SOP and includes the procedures that must be followed when your unit is deployed.
- Activated NGB and USAR units should contact the installation ASAP that supports the first active component unit in their chain of command to receive a copy of the Deployment Testing SOP and establish communication.

Deployment Testing SOP

- The Deployment SOP includes:
  - Pre-deployment coordination requirements with the ASAP to ensure deploying units will be able to conduct testing and receive testing results while deployed.
  - UPL training requirements (pre-deployment)
  - Information on the BAC to use while deployed.
  - Where and how to ship your specimens – either to your installation ASAP or directly to the laboratory.
  - Refresher training on conducting an in depth quality control check of the specimens before shipping.
  - How to request supplies

Deployment Testing SOP

- The Deployment Testing SOP is a living document. As services and support in a deployment area increase, the testing, handling, quality control and shipping requirements may change. Therefore it is imperative that:
  - Active component units maintain contact with their home ASAP and share information with attached or subordinate activated units
  - Activated units contact their higher headquarters for guidance and POCs and then establish communication with their supporting ASAP
